By Peter Bürgisser, Michael Clausen, Mohammad A. Shokrollahi : Algebraic Complexity Theory (Grundlehren der mathematischen Wissenschaften)

in mathematics a group is an algebraic structure consisting of a set of elements equipped with an operation that combines any two elements to form a third element mathematical logic is a subfield of mathematics exploring the applications of formal logic to mathematics it bears close connections to metamathematics the Algebraic Complexity Theory (Grundlehren der mathematischen Wissenschaften):

The algorithmic solution of problems has always been one of the major concerns of mathematics For a long time such solutions were based on an intuitive notion of algorithm It is only in this century that metamathematical problems have led to the intensive search for a precise and sufficiently general formalization of the notions of computability and algorithm In the 1930s a number of quite different concepts for this purpose were pro shy posed such as Turing machin
